

WORK SHEET

Module 3.5 Forward Perpendicular Parking and Un-Parking

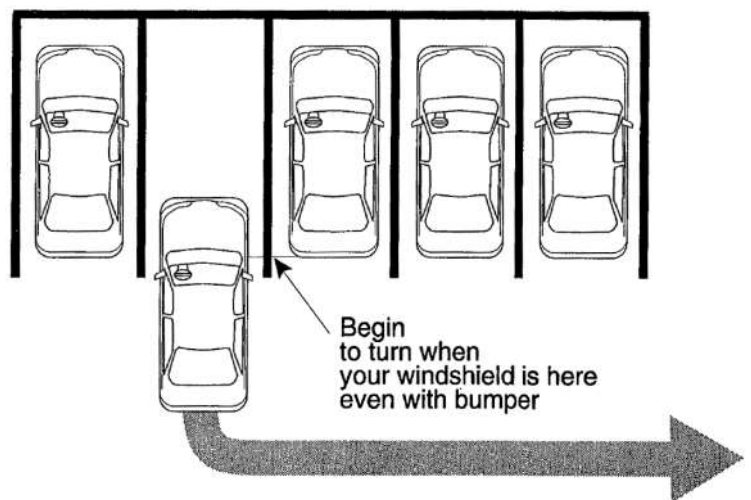

PARKING

1. Approach 7-8 feet away from the other parked cars.
2. Make sure that there is no on-coming traffic.
3. Look to your target in the center of the stall.
4. Begin your turn when your vision doesn't cut across the back of the car and line of the parking stall.
5. Pull to the front limitation using your reference point lines up up with the front line of the parking space.
6. Secure the vehicle and exit.

UNPARKING

1. To un-park perform a 360° search.
2. Foot on brake, shift to reverse look to the rear and use inching speed to back up.
3. Begin to turn when front corner post lines up with back bumper of the car next to you.
4. Watch your car's front swing on the left to make sure you clear the front as you turn.

Note: It is far less risky to back into a 90° perpendicular parking space. But if you have no other choice and must pull in forward into a 90° space, do only one thing differently than the 45° angle park; begin your turn when the bottom of the outside mirror aligns with nearest edge of space.
